

Custom theme sizing

Fixed-output parity

This deck is a visual regression check for the custom-theme sizing fix.

- The same theme tokens apply to the responsive canvas and fixed 1280 × 720 output.
- PNG capture, PDF, and editable PowerPoint use the fixed output surface.
- The heading, body, code, kicker, table, rule, and diagram tokens are intentionally visible.

Typography and spacing tokens

The custom theme owns the type scale and slide density in every output mode.

Token	Value	Visible effect
<code>--slide-h1-size</code>	<code>42px</code>	Heading scale
<code>--slide-body-size</code>	<code>19px</code>	Body scale
<code>--deck-pad-x</code>	<code>72px</code>	Horizontal margin
<code>--deck-pad-y</code>	<code>44px</code>	Vertical margin
<code>--kicker-size</code>	<code>14px</code>	Kicker scale

The explicit `size: normal` keeps the comparison deterministic.

Tables, rules, and code

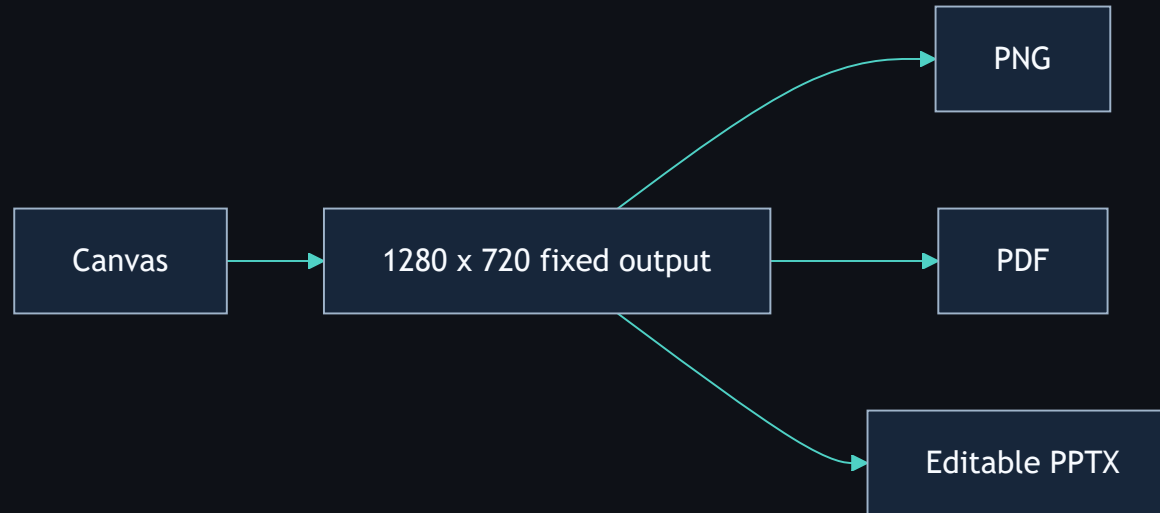

The remaining decoration tokens are also shared by responsive and fixed output.

```
const output = ["canvas", "png", "pdf", "pptx"];
console.log(output.join(" = "));
```

Surface	Expected result
Canvas	Same colors, margins, and type scale
PNG / PDF	Same 1280 × 720 geometry
PPTX	Same slide geometry with editable text

Diagram and image bounds

The fixed output uses the same custom maximum-height tokens as the canvas.

All four surfaces should preserve the same diagram scale, margins, and accent colors.
